

# EDIT 2013: Excellence in Detectors and Instrumentation Technologies

KEK, March 12 - 22, 2013

## Detectors for luminosity frontier collider experiments

**Peter Križan**

*University of Ljubljana and J. Stefan Institute*

# Contents

---

- Highlights from B factories (+ a little bit of history)
- Physics case for a super B factory
- Accelerator
- Detector upgrade
- Status and outlook

... Unfortunately, not enough time to cover LHCb

# A little bit of history...

---

**CP violation:** difference in the properties of **particles** and their **anti-particles**  
– first observed in 1964 in the decays of neutral kaons.

**M. Kobayashi and T. Maskawa (1973):** **CP violation** in the Standard model – related to the weak interaction **quark transition matrix**

Their theory was formulated at a time when three quarks were known – and they requested the existence of three more!

The last missing quark was found in 1994.

... and in 2001 two experiments – Belle and BaBar at two powerfull accelerators (B factories) - have further investigated CP violation and have indeed proven that it is tightly connected to the quark transition matrix

# CKM - Cabibbo-Kobayashi-Maskawa (quark transition) matrix:

almost real and diagonal, but not completely!

$V_{ud}$

$V_{us}$

$V_{ub}$

Amplitude for  
the  $b \rightarrow u$   
transition

$V_{cd}$

$V_{cs}$

$V_{cb}$

Amplitude for  
the  $b \rightarrow c$   
transition

$V_{td}$

$V_{ts}$

$V_{tb}$

CKM: unitary  
matrix

# CKM matrix: determines charged weak interaction of quarks

Wolfenstein parametrisation: expand the CKM matrix in the parameter  $\lambda$  ( $=\sin\theta_c=0.22$ )

$A$ ,  $\rho$  and  $\eta$ : all of order one

$$V = \begin{pmatrix} 1 - \frac{\lambda^2}{2} & \lambda & A\lambda^3(\rho - i\eta) \\ -\lambda & 1 - \frac{\lambda^2}{2} & A\lambda^2 \\ A\lambda^3(1 - \rho - i\eta) & -A\lambda^2 & 1 \end{pmatrix} + O(\lambda^4)$$

determines probability of  $b \rightarrow u$  transitions

7-92

determines CP violation in  $B \rightarrow J/\psi K_S$  decays

Unitarity condition:

$$V_{ud} V_{ub}^* + V_{cd} V_{cb}^* + V_{td} V_{tb}^* = 0$$

Goal: measure sides and angles in several different ways, check consistency  $\rightarrow$

# Asymmetric B factories

**BaBar**      $p(e^-) = 9 \text{ GeV}$     $p(e^+) = 3.1 \text{ GeV}$

$\beta\gamma = 0.56$

**Belle**      $p(e^-) = 8 \text{ GeV}$     $p(e^+) = 3.5 \text{ GeV}$

$\beta\gamma = 0.42$

# Unitarity triangle – 2011 vs 2001

CP violation in the B system: from the **discovery** (2001) to a **precision measurement** (2011).

# KM's bold idea verified by experiment

Relations between parameters  
as expected in the Standard  
model →

Nobel prize 2008!

→ With essential experimental confirmations by BaBar and Belle! (explicitly noted in the Nobel Prize citation)

# The KM scheme is now part of the Standard Model of Particle Physics

- However, the CP violation of the KM mechanism is too small to account for the asymmetry between matter and anti-matter in the Universe (falls short by 10 orders of magnitude !)
- SM does not contain the fourth fundamental interaction, gravitation
- Most of the Universe is made of stuff we do not understand...

Are we done ? (Didn't the B factories accomplish their mission, recognized by the 2008 Nobel Prize in Physics ?)

Из эссе С. Окубо  
при большой температуре  
для Вселенной суща мучба  
но ее кривой фигуре

НАРУШЕНИЕ CP-ИНВАРИАНТНОСТИ, C-АСИММЕТРИЯ  
И БАРИОННАЯ АСИММЕТРИЯ ВСЕЛЕННОЙ

А.Д. Сахаров

Теория расширяющейся Вселенной, предполагающая сверхплотное начальное состояние вещества, по-видимому, исключает возможность макроскопического разделения вещества и антивещества; поэтому следует

Matter - anti-matter  
asymmetry of the Universe:  
KM (Kobayashi-Maskawa)  
mechanism still short by 10  
orders of magnitude !!!

# Two frontiers

---

Two complementary approaches to study shortcomings of the Standard Model and to search for the so far unobserved processes and particles (so called New Physics, NP). These are the **energy frontier** and the **intensity frontier**.

**Energy frontier** : direct search for production of unknown particles at the highest achievable energies.

**Intensity frontier** : search for rare processes, deviations between theory predictions and experiments with the ultimate precision.

→ for this kind of studies, one has to investigate a very large number of reactions events → need accelerators with ultimate **intensity** (= luminosity)

# Comparison of **energy** / **intensity** frontiers

To observe a large ship far away one can either use **strong binoculars** or observe **carefully the direction and the speed of waves** produced by the vessel.

Energy frontier (LHC)

Luminosity frontier  
(Belle and Belle II)

# An example: Hunting the **charged Higgs** in the decay $B^- \rightarrow \tau^- \nu_\tau$

In addition to the Standard Model Higgs – most probably just discovered at the LHC - in New Physics (e.g., in supersymmetric theories) there could also be a **charged Higgs**.

The rare decay  $B^- \rightarrow \tau^- \nu_\tau$  is in SM mediated by the **W boson**

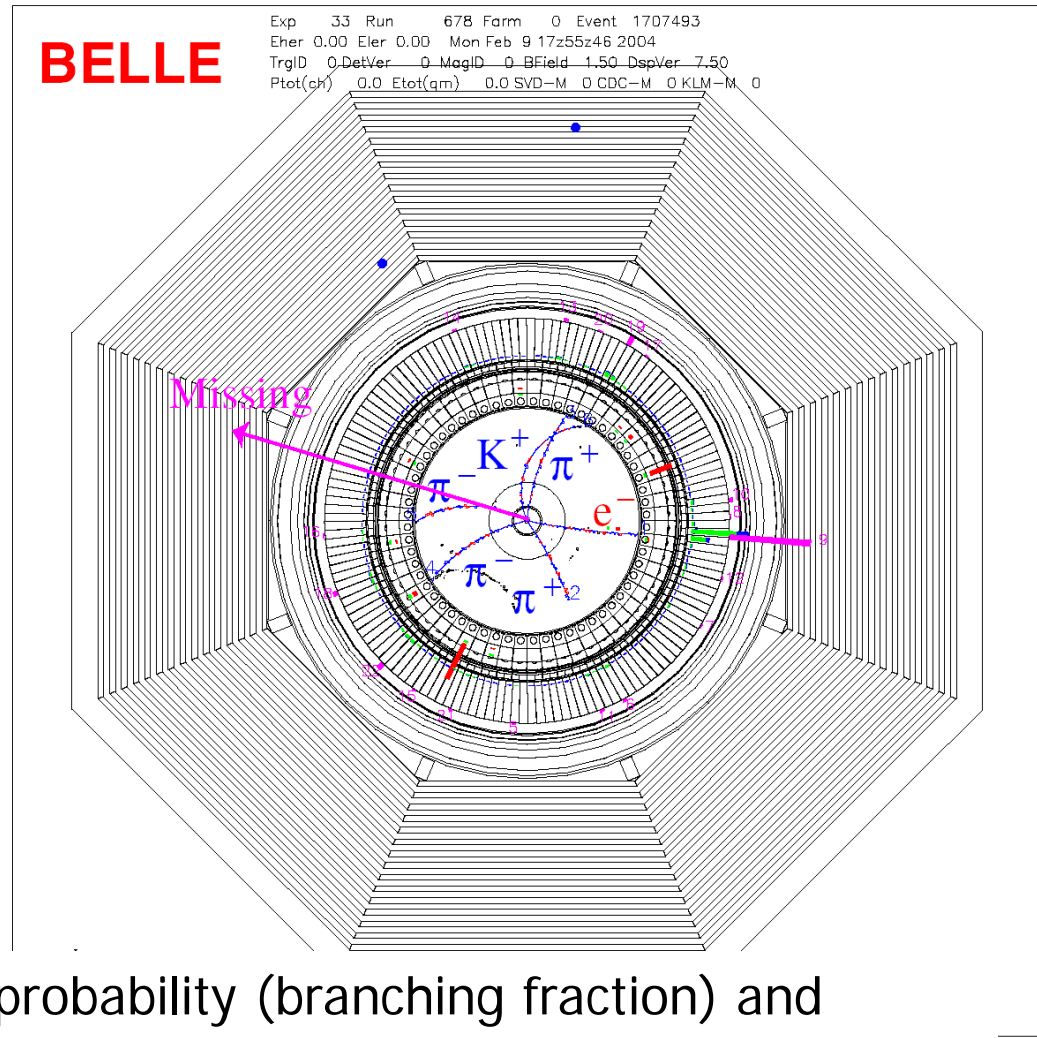

In some supersymmetric extensions it can also proceed via a **charged Higgs**

The **charged Higgs** would influence the decay of a B meson to a tau lepton and its neutrino, and modify the probability for this decay.

# Missing Energy Decays: $B^- \rightarrow \tau^- \nu_\tau$

$$B^+ \rightarrow D^0 \pi^+ \\ (\rightarrow K \pi^- \pi^+ \pi^-) \\ B^- \rightarrow \tau (\rightarrow e \nu \bar{\nu}) \nu$$

By measuring the decay probability (branching fraction) and comparing it to the SM expectation:

→ Properties of the charged Higgs (e.g. its mass)

# New Physics reach

## energy frontier vs. intensity frontier

NP mass scale  
(TeV)

# Super B Factory Motivation 2

- Lessons from history: the top quark

## Physics of top quark

First estimate of mass: BB mixing → ARGUS  
Direct production, Mass, width etc. → CDF/D0  
Off-diagonal couplings, phase → BaBar/Belle

$$V_{CKM} = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix}$$

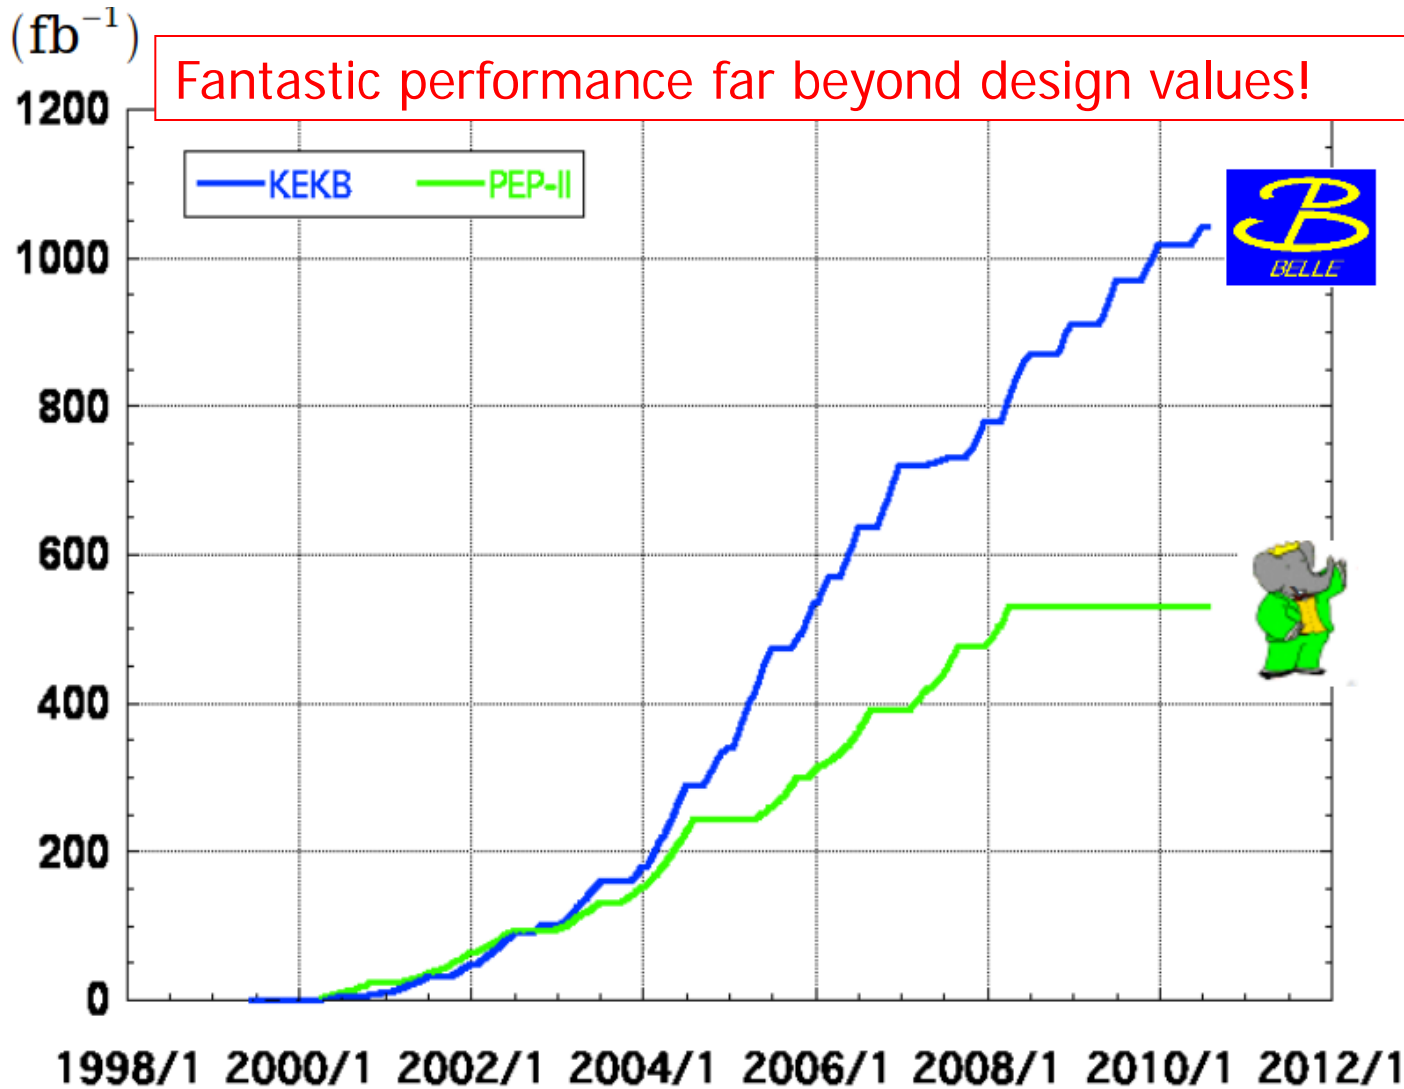

- Even before that: prediction of charm quark from the GIM mechanism, and its mass from  $K^0$  mixing

# B factories: a success story

- Measurements of CKM matrix elements and angles of the unitarity triangle
- Observation of direct CP violation in B decays
- Measurements of rare decay modes (e.g.,  $B \rightarrow \tau \nu$ ,  $D \tau \nu$ )
- $b \rightarrow s$  transitions: probe for new sources of CPV and constraints from the  $b \rightarrow s \gamma$  branching fraction
- Forward-backward asymmetry ( $A_{FB}$ ) in  $b \rightarrow sl^+l^-$  has become a powerful tool to search for physics beyond SM.
- Observation of D mixing
- Searches for rare  $\tau$  decays
- Observation of new hadrons

# Integrated luminosity at B factories

**> 1 ab<sup>-1</sup>**

**On resonance:**

$\Upsilon(5S)$ : 121 fb<sup>-1</sup>

$\Upsilon(4S)$ : 711 fb<sup>-1</sup>

$\Upsilon(3S)$ : 3 fb<sup>-1</sup>

$\Upsilon(2S)$ : 25 fb<sup>-1</sup>

$\Upsilon(1S)$ : 6 fb<sup>-1</sup>

**Off reson./scan:**

~ 100 fb<sup>-1</sup>

**~ 550 fb<sup>-1</sup>**

**On resonance:**

$\Upsilon(4S)$ : 433 fb<sup>-1</sup>

$\Upsilon(3S)$ : 30 fb<sup>-1</sup>

$\Upsilon(2S)$ : 14 fb<sup>-1</sup>

**Off resonance:**

~ 54 fb<sup>-1</sup>

# What next?

---

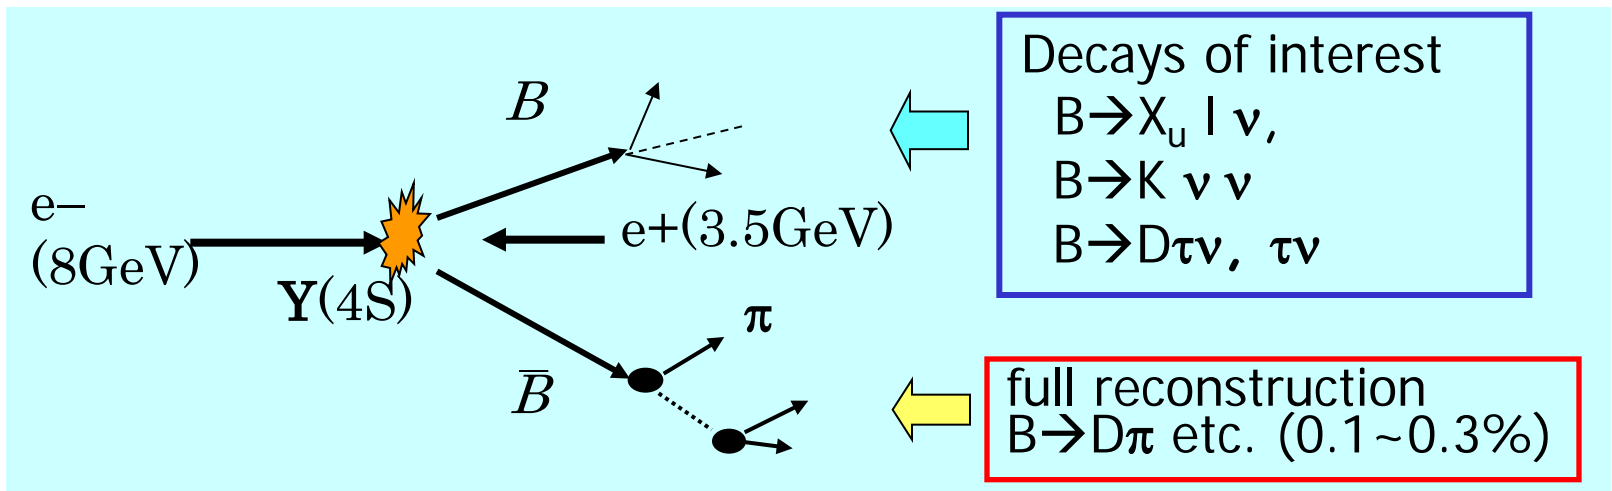

To search for NP effects, need **much more data** (two orders!) →  
**Luminosity frontier** experiment → **Super B factory**

However: it will be a **different world** in four years, there will be  
serious competition from **LHCb** and **BESIII**

Still,  $e^+e^-$  machines running at (or near)  $\Upsilon(4s)$  will have **considerable**  
**advantages in several classes of measurements**, and will be  
**complementary in many more**

# Full Reconstruction Method

- Fully reconstruct one of the B's to
  - Tag B flavor/charge
  - Determine B momentum
  - Exclude decay products of one B from further analysis

→ Offline B meson beam!

Powerful tool for B decays with neutrinos

# Missing Energy Decays: $B^- \rightarrow \tau^- \nu_\tau$

$$B^+ \rightarrow D^0 \pi^+ \\ (\rightarrow K \pi^- \pi^+ \pi^-) \\ B^- \rightarrow \tau (\rightarrow e \nu \bar{\nu}) \nu$$

# B $\rightarrow$ $\nu \nu$ decay

B  $\rightarrow$   $\nu \nu$  similar as B  $\rightarrow$   $\mu \mu$  a very sensitive channel to NP contributions

Even more strongly helicity suppressed by  $\sim (m_\nu/m_B)^2$

$\rightarrow$  Any signal = NP

Unique feature at B factories: use tagged sample with fully reconstructed B decays on one side, require no signal from the other B.

Use rest energy in the calorimeter and angular distribution as the fit variables.

**90% C.L. BR  $< 1.3 \times 10^{-4}$**   
Belle Preliminary 657M BBbar

c.f. (Babar) BR  $< 2.2 \times 10^{-4}$

# LFV and New Physics

$\tau \rightarrow l \gamma$

- SUSY + Seesaw ( $m_{\tilde{l}}^2$ )<sub>23(13)</sub>
- Large LFV  $Br(\tau \rightarrow \mu \gamma) = O(10^{-7 \sim 9})$

$$Br(\tau \rightarrow \mu \gamma) \approx 10^{-6} \times \left( \frac{(m_{\tilde{L}}^2)_{32}}{\bar{m}_{\tilde{L}}^2} \right) \left( \frac{1 \text{ TeV}}{m_{\text{SUSY}}} \right)^4 \tan^2 \beta$$

$\tau \rightarrow 3l, l \eta$

- Neutral Higgs mediated decay.
- Important when  $M_{\text{SUSY}} \gg \text{EW scale}$ .

$$Br(\tau \rightarrow 3\mu) =$$

$$4 \times 10^{-7} \times \left( \frac{(m_{\tilde{L}}^2)_{32}}{\bar{m}_{\tilde{L}}^2} \right) \left( \frac{\tan \beta}{60} \right)^6 \left( \frac{100 \text{ GeV}}{m_A} \right)^4$$

model	$Br(\tau \rightarrow \mu \gamma)$	$Br(\tau \rightarrow 3l)$
mSUGRA+seesaw	$10^{-7}$	$10^{-9}$
SUSY+SO(10)	$10^{-8}$	$10^{-10}$
SM+seesaw	$10^{-9}$	$10^{-10}$
Non-Universal $Z'$	$10^{-9}$	$10^{-8}$
SUSY+Higgs	$10^{-10}$	$10^{-7}$

# Physics at a Super B Factory

- There is a good chance to see new phenomena;
  - **CPV in B decays from the new physics (non KM).**
  - **Lepton flavor violations in  $\tau$  decays.**
- They will help to diagnose (if found) or constrain (if not found) new physics models.
- $B \rightarrow \tau \nu$ ,  $D \tau \nu$  can probe the charged Higgs in large  $\tan\beta$  region.
- **Physics motivation is independent of LHC.**
  - If LHC finds NP, precision flavour physics is compulsory.
  - If LHC finds no NP, high statistics B/ $\tau$  decays would be a unique way to search for the  $> \text{TeV}$  scale physics (=TeV scale in case of MFV).

Physics reach with  $50 \text{ ab}^{-1}$ :

- Physics at Super B Factory (Belle II authors + guests)  
hep-ex arXiv:1002.5012

How to do it?  
→ upgrade KEKB and Belle

# Accelerator

---

# The KEKB Collider

Fantastic performance far beyond design values!

- e<sup>-</sup> (8 GeV) on e<sup>+</sup> (3.5 GeV)
  - $\sqrt{s} \approx m_{\Upsilon(4S)}$
  - Lorentz boost:  $\beta\gamma=0.425$
- 22 mrad crossing angle

**Peak luminosity (WR!) :**  
 **$2.1 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$**   
**=2x design value**

First physics run on June 2, 1999  
Last physics run on June 30, 2010  
 $L_{\text{peak}} = 2.1 \times 10^{34} / \text{cm}^2 / \text{s}$   
 $L > 1 \text{ ab}^{-1}$

# SuperKEKB is the intensity frontier

Peak luminosity trends ( $e^+e^-$  colliders)

# How to increase the luminosity?

$$L = \frac{\gamma_{e\pm}}{2er_e} \left( 1 + \frac{\sigma_y^*}{\sigma_x^*} \right) \left( \frac{I_{e\pm} \xi_{\zeta y}^{e\pm}}{\beta_y^*} \right) \left( \frac{R_L}{R_{\xi_y}} \right)$$

Lorentz factor  $\rightarrow$   $\gamma_{e\pm}$   
 Beam current  $\rightarrow$   $I_{e\pm}$   
 Beam-beam parameter  $\rightarrow$   $\xi_{\zeta y}^{e\pm}$   
 Classical electron radius  $\rightarrow$   $r_e$   
 Beam size ratio@IP  $\rightarrow$   $\frac{\sigma_y^*}{\sigma_x^*}$   
 Vertical beta function@IP  $\rightarrow$   $\beta_y^*$   
 Lumi. reduction factor (crossing angle) & Tune shift reduction factor (hour glass effect)  $\rightarrow$   $\frac{R_L}{R_{\xi_y}}$   
 0.8 - 1 (short bunch)

- (1) Smaller  $\beta_y^*$
- (2) Increase beam currents
- (3) Increase  $\xi_{\zeta y}$

**"Nano-Beam" scheme**

## Collision with very small spot-size beams

Invented by Pantaleo Raimondi for SuperB – 'spin-off' of linear collider studies

# How big is a nano-beam ?

How to go from an excellent accelerator with world record performance – KEKB – to a 40x times better, more intense facility?

In KEKB, colliding electron and positron beams are **much thinner than the human hair...**

... For a 40x increase in intensity you have to make the beam as thin as a **few 100 atomic layers!**

# Machine design parameters

parameters		KEKB		SuperKEKB		units
		LER	HER	LER	HER	
Beam energy	$E_b$	3.5	8	4	7	GeV
Half crossing angle	$\varphi$	11		41.5		mrad
Horizontal emittance	$\epsilon_x$	18	24	3.2	4.6	nm
Emittance ratio	$\kappa$	0.88	0.66	0.37	0.40	%
Beta functions at IP	$\beta_x^*/\beta_y^*$	1200/5.9		32/0.27	25/0.30	mm
Beam currents	$I_b$	1.64	1.19	3.60	2.60	A
beam-beam parameter	$\xi_y$	0.129	0.090	0.0881	0.0807	
<b>Luminosity</b>	<b>L</b>	<b><math>2.1 \times 10^{34}</math></b>		<b><math>8 \times 10^{35}</math></b>		<b><math>\text{cm}^{-2}\text{s}^{-1}</math></b>

- **Nano-beams and a factor of two more beam current** to increase luminosity
- **Large crossing angle**
- **Change beam energies** to solve the problem of short lifetime for the LER

# KEKB to SuperKEKB

Colliding bunches

New superconducting / permanent final focusing quads near the IP

Replace short dipoles with longer ones (LER)

Redesign the lattices of HER & LER to squeeze the emittance

TiN-coated beam pipe with antechambers

*To obtain x40 higher luminosity*

**1/3 of new dipole magnets have been installed in LER.  
(July 9, 2012)**

***Three magnets per day !  
Total ~100***

- Installing the 4 m LER dipole over the 6 m HER dipole (remains in place).
- All LER dipoles are scheduled to be installed this year.

# Entirely new LER beam pipe with ante-chamber and Ti-N coating

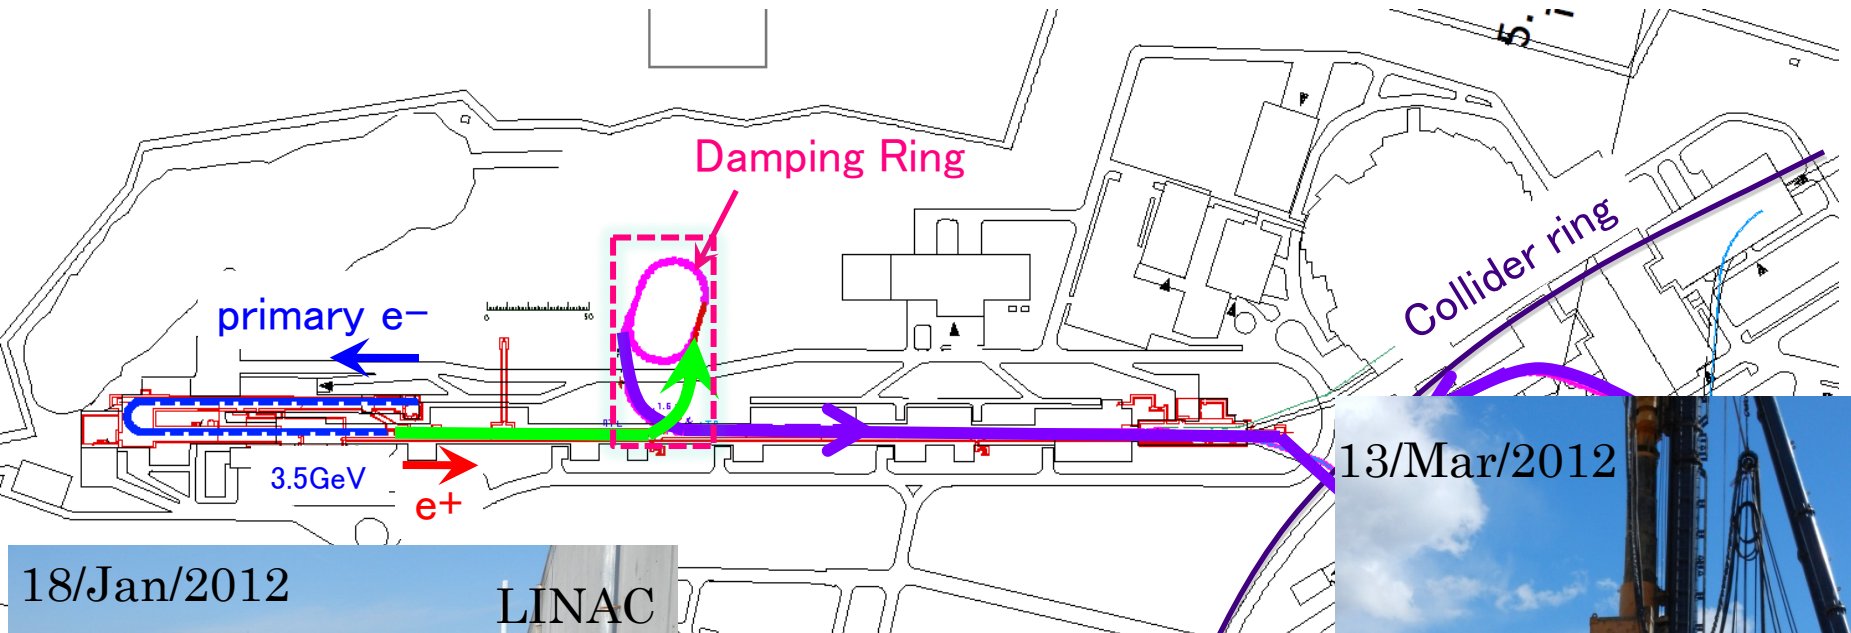

Beam pipe is made of aluminum.

Fabrication of the LER arc beam pipe section is completed

# Damping ring construction started in Jan 2012

13/Mar/2012

# TiN Coating Machine

Beam pipe with TiN coating reduces emission of secondary photoelectrons.

TiN coating machine (1st vertical type) in Oho experimental hall

Now we have two coating machines.

TiN coating has started – in a good shape

# Experimental apparatus

---

# Typical measurement

# Components of an experimental apparatus ('spectrometer')

---

- Tracking and vertexing systems
- Particle identification devices
- Calorimeters (measurement of energy)

# How to understand what happened in a collision?

Illustration on an example:

$$B^0 \rightarrow K_S^0 J/\psi$$

$$K_S^0 \rightarrow \pi^- \pi^+$$

$$J/\psi \rightarrow \mu^- \mu^+$$

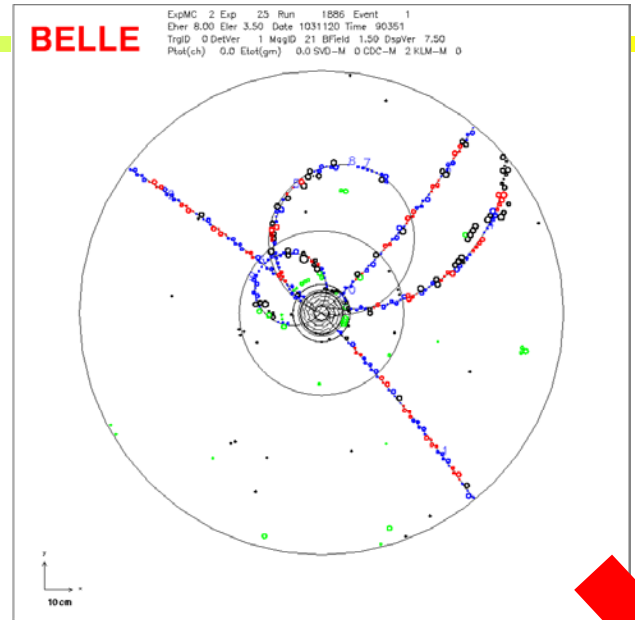

# Need to build a new detector to handle higher backgrounds

Critical issues at  $L = 8 \times 10^{35} / \text{cm}^2 / \text{sec}$

- ▶ **Higher background ( $\times 10\text{-}20$ )**
  - radiation damage and occupancy
  - fake hits and pile-up noise in the EM
- ▶ **Higher event rate ( $\times 10$ )**
  - higher rate trigger, DAQ and computing
- ▶ **Require special features**
  - low  $p \mu$  identification  $\leftarrow s \mu \mu$  recon. eff.
  - hermeticity  $\leftarrow \nu$  "reconstruction"

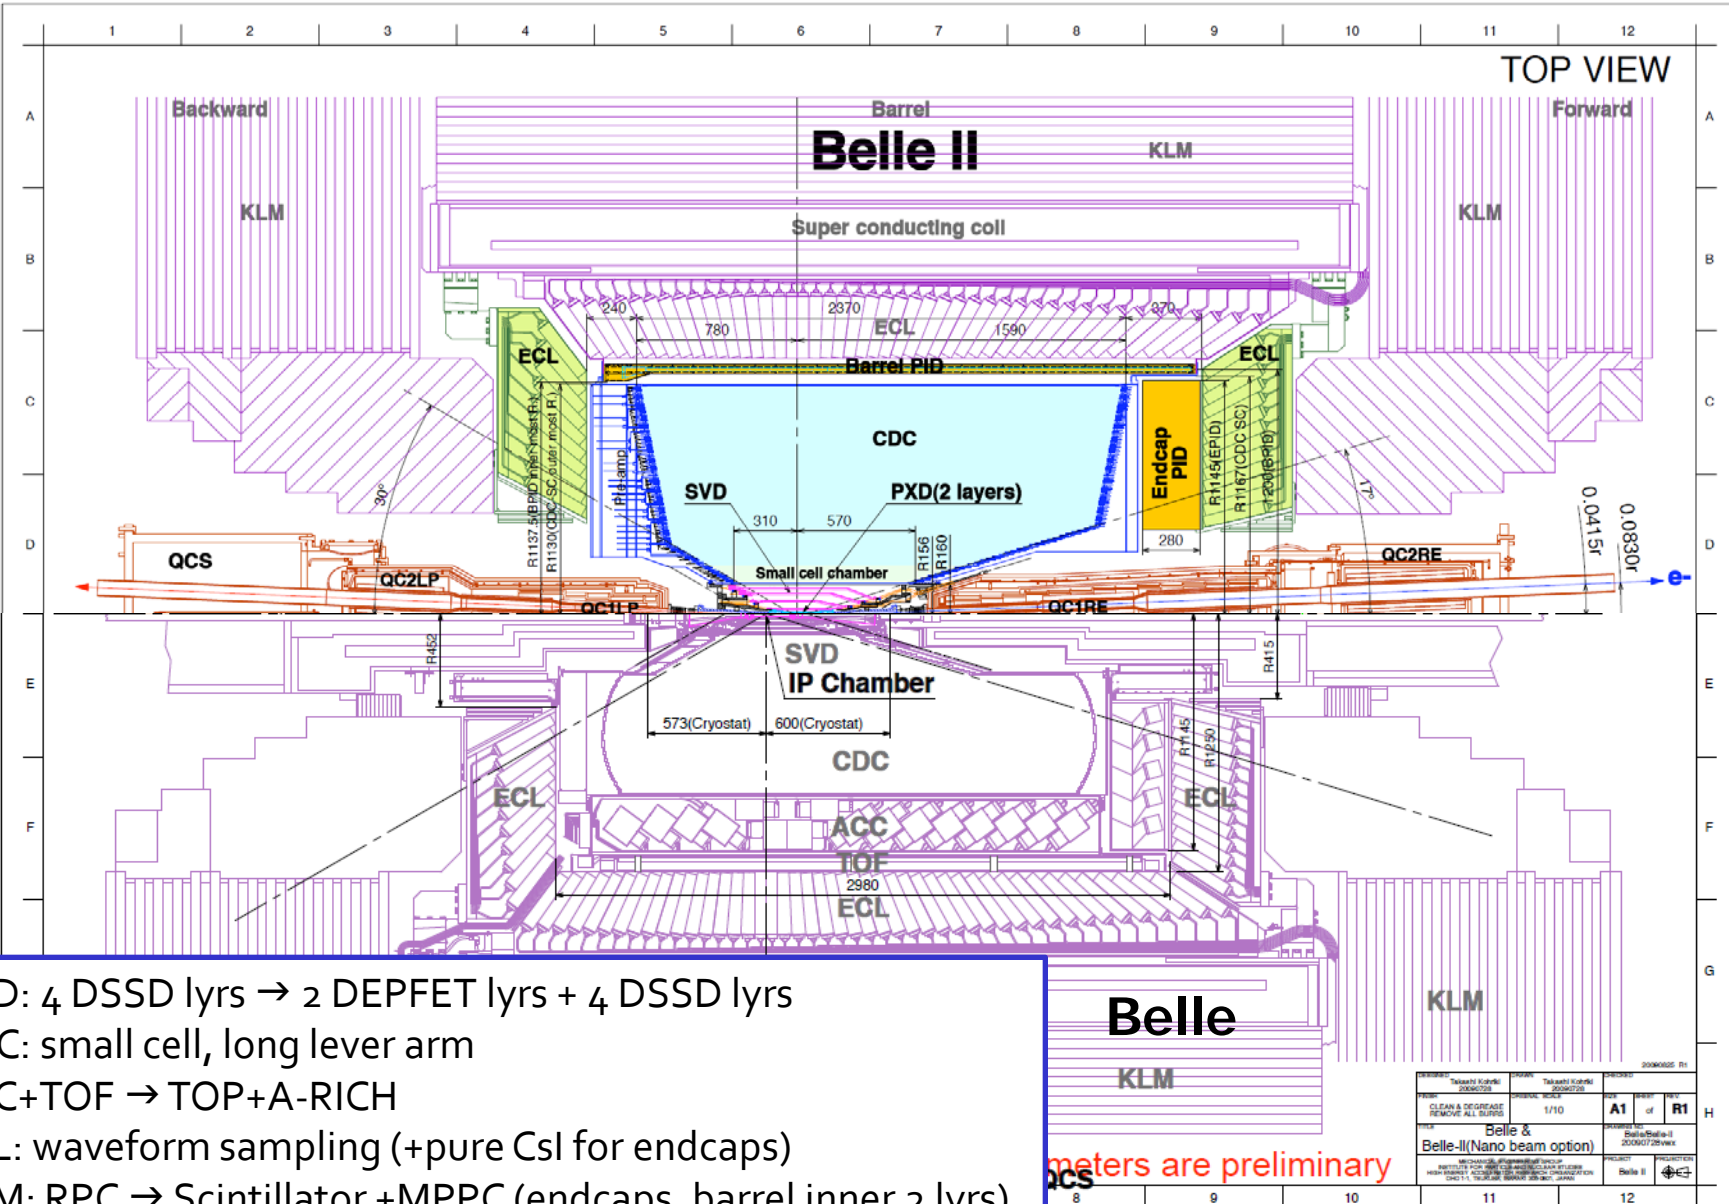

Have to employ and develop new technologies to make such an apparatus work!

# Belle II Detector

# Belle II Detector (in comparison with Belle)

**SVD:** 4 DSSD lrs → 2 DEPFET lrs + 4 DSSD lrs  
**CDC:** small cell, long lever arm  
**ACC+TOF → TOP+A-RICH**  
**ECL:** waveform sampling (+pure CsI for endcaps)  
**KLM:** RPC → Scintillator +MPPC (endcaps, barrel inner 2 lrs)

Dimensions are preliminary

0000002-01 CLEAN & DEGREASE REMOVE ALL BURRS Belle & Belle-II Belle-II(Nano beam option) 25/06/07 28/06/07 Belle II	1/10 A1 of R1	R1
---	------------------	----

# Tracking and vertex systems in Belle II

# Belle II Detector – vertex region

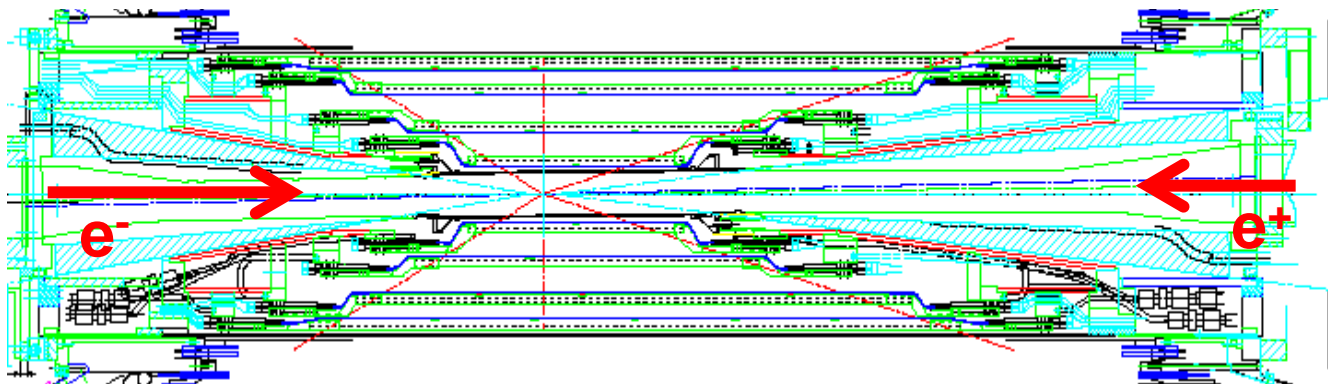

Beryllium beam pipe  
2cm diameter

Vertex Detector  
2 layers DEPFET + 4 layers DSSD

# Silicon vertex detector (SVD)

Two coordinates measured at the same time;  
strip pitch: 50 μm (75 μm);  
resolution 15 μm (20 μm).

# Belle II Vertex detector SVD+PXD

- Sensors of the innermost layers:  
Normal double sided Si detector (DSSD) → DEPFET Pixel sensors
- Configuration: 4 layers → 6 layers  
(outer radius = 8cm → 14cm)
  - More robust tracking
  - Higher Ks vertex reconstruction efficiency
- Inner radius: 1.5cm → 1.3cm
  - Better vertex resolution
- Strip Readout chip: VA1TA → APV25
  - Reduction of occupancy coming from beam background.
  - Pipeline readout to reduce dead time.

Slant layer to keep the acceptance

# Pixel vertex detector PXD principle: DEPFET

p-channel FET on a completely depleted bulk

A deep n-implant creates a potential minimum for electrons under the gate ("internal gate")

Signal electrons accumulate in the internal gate and modulate the transistor current ( $g_q \sim 400 \text{ pA/e}^-$ )

Accumulated charge can be removed by a clear contact ("reset")

Invented in MPI Munich

Fully depleted:

→ large signal, fast signal collection

Low capacitance, internal amplification → low noise

Depleted p-channel FET

Transistor on only during readout:  
low power

Complete clear → no reset noise

# Vertex Detector

<b>Beam Pipe</b>		<b>r = 10mm</b>
<b>DEPFET</b>	<b>Layer 1</b>	<b>r = 14mm</b>
	<b>Layer 2</b>	<b>r = 22mm</b>
<b>DSSD</b>	<b>Layer 3</b>	<b>r = 38mm</b>
	<b>Layer 4</b>	<b>r = 80mm</b>
	<b>Layer 5</b>	<b>r = 115mm</b>
	<b>Layer 6</b>	<b>r = 140mm</b>

Mechanical mockup of pixel detector

DEPFET pixel sensor

DEPFET sensor: very good S/N

# Expected performance

$$\sigma = a + \frac{b}{p\beta \sin^v \theta}$$

Significant improvement in vertex resolution!

Less Coulomb scattering

Significant improvement in  $\delta S(K_S \pi^0 \gamma)$

B decay point reconstruction with  $K_S$  trajectory

Main tracking device: small cell drift chamber

Central Drift Chamber  
He(50%):C<sub>2</sub>H<sub>6</sub>(50%), small cells, long lever arm, fast electronics

# Tracking: Belle central drift chamber

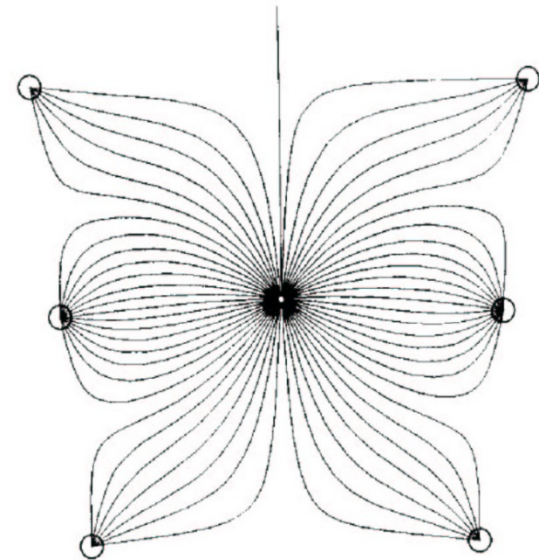

- 50 layers of wires (8400 cells) in 1.5 Tesla magnetic field
- Helium:Ethane 50:50 gas, W anode wires, Al field wires, CF inner wall with cathodes, and preamp only on endplates
- Particle identification from ionization loss (5.6-7% resolution)

# Drift chamber with small cells

One big gas volume, small cells defined by the anode and field shaping (potential) wires

# Belle II CDC

## Wire Configuration

## Wire stringing in a clean room

- thousands of wires,
- 1 year of work...

# Particle identification systems in Belle II

EM Calorimeter:  
CsI(Tl), waveform sampling (barrel)  
Pure CsI + waveform sampling (end-caps)

KL and muon detector:  
Resistive Plate Counter (barrel outer layers)  
Scintillator + WLSF + MPPC (end-caps ,  
inner 2 barrel layers)

electrons (7GeV)

Particle Identification  
Time-of-Propagation counter (barrel)  
Prox. focusing Aerogel RICH (fwd)

Beryllium beam pipe  
2cm diameter

Vertex Detector  
2 layers DEPFET + 4 layers DSSD

positrons (4GeV)

Central Drift Chamber  
He(50%):C<sub>2</sub>H<sub>6</sub>(50%), small cells, long  
lever arm, fast electronics

# Identification of charged particles

---

Particles are identified by their **mass** or by the **way they interact**.

**Determination of mass:** from the relation between momentum and velocity,  $p = \gamma m v$ .

Momentum known (radius of curvature in magnetic field)

→ Measure velocity:

time of flight

ionisation losses  $dE/dx$

Cherenkov angle

transition radiation

Mainly used for the identification of hadrons.

**Identification through interaction:** electrons and muons

# PID coverage of kaon/pion spectra

Tagging Kaons

$B \rightarrow \pi\pi$

$B \rightarrow DK$

# PID coverage of kaon/pion spectra

Tagging Kaons

$B \rightarrow \pi\pi$

$B \rightarrow DK$

# Identification with the $dE/dx$ measurement

$dE/dx$  is a function of velocity  $\beta$   
For particles with different mass the  
Bethe-Bloch curve gets displaced  
if plotted as a function of  $p$

For good separation: resolution should be  $\sim 5\%$

Measure in each drift chamber layer – use truncated mean

# Requirements: Particle Identification

**Tagging Kaons**

Relatively soft,  
ms dominated  
for tracking

**$B \rightarrow \pi\pi$**

Requires  
dedicated PID

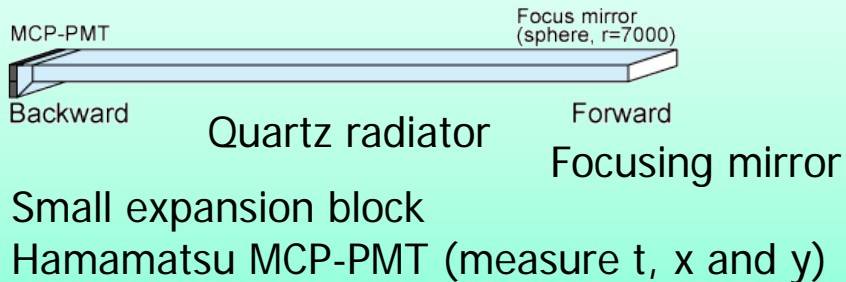

**$B \rightarrow DK$**

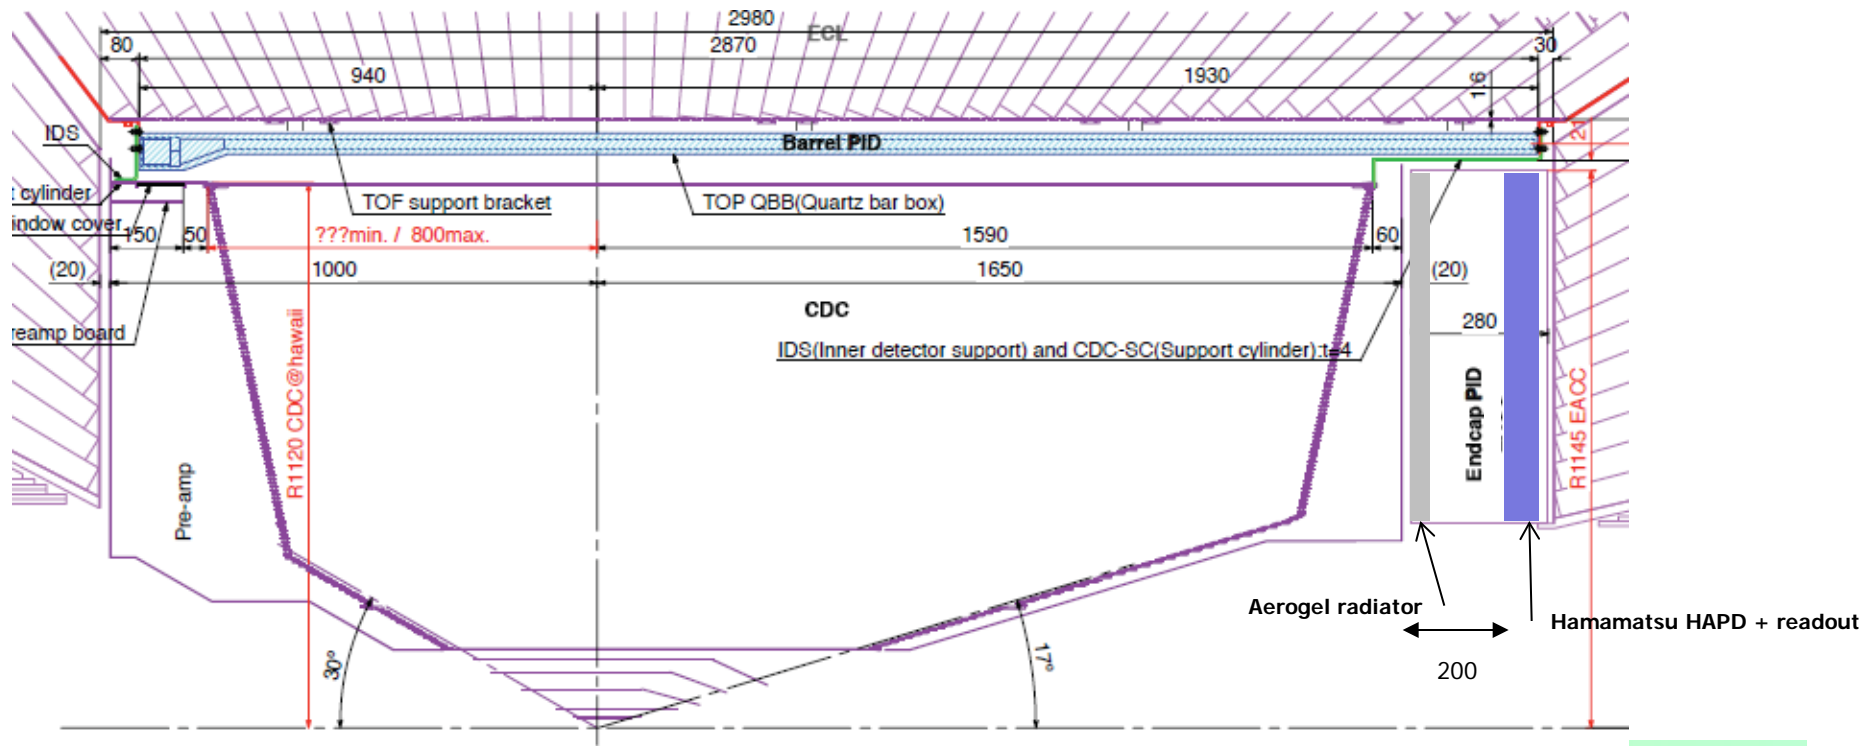

Requires  
dedicated PID

# Cherenkov detectors

## Barrel PID: Time of Propagation Counter (TOP)

## Endcap PID: Aerogel RICH (ARICH)

# Cherenkov radiation

A charged track with velocity  $v = \beta c$  exceeding the speed of light  $c/n$  in a medium with refractive index  $n$  emits **polarized light** at a characteristic (Cherenkov) angle,

$$\cos\theta = c/nv = 1/\beta n$$

Two cases:

- $\beta < \beta_t = 1/n$ : below threshold **no** Cherenkov light is emitted.
- $\beta > \beta_t$ : the number of Cherenkov photons emitted over unit photon energy  $E = h\nu$  in a radiator of length  $L$ :

$$\frac{dN}{dE} = \frac{\alpha}{\hbar c} L \sin^2 \theta = 370(\text{cm})^{-1} (\text{eV})^{-1} L \sin^2 \theta$$

→ Few detected photons

# Measuring the Cherenkov angle

Idea: transform the direction into a coordinate → ring on the detection plane → Ring Imaging Cherenkov (RICH) counter

## Proximity focusing RICH

RICH with a focusing mirror

# Measuring Cherenkov angle

Radiator:  
 $C_4F_{10}$  gas

thresholds

# Aerogel RICH (endcap PID)

Clear Cherenkov image observed

Cherenkov angle distribution

**6.6  $\sigma$   $\pi/K$  at 4GeV/c !**

Peter Križan, Ljubljana

RICH with a novel "focusing" radiator – a two layer radiator

Employ multiple layers with different refractive indices → Cherenkov images from individual layers overlap on the photon detector.

# Radiator with multiple refractive indices

How to increase the number of photons without degrading the resolution?

normal

→ stack two tiles with different refractive indices:  
“focusing” configuration

→ focusing radiator

Such a configuration is only possible with aerogel (a form of  $\text{Si}_x\text{O}_y$ )  
– material with a tunable refractive index between 1.01 and 1.13.

# Focusing configuration – data

Increases the number of photons without degrading the resolution

## 4cm aerogel single index

## 2+2cm aerogel

→ NIM A548 (2005) 383

Another candidate: SiPM

Another sensor candidate: SiPMs (G-PAD), easy to handle, but never before used for single photon detection (high dark count rate with single photon pulse height) → use a narrow time window and light concentrators

# Cherenkov ring with SiPMs

---

First successful use of SiPMs as single photon detectors in a RICH counter!

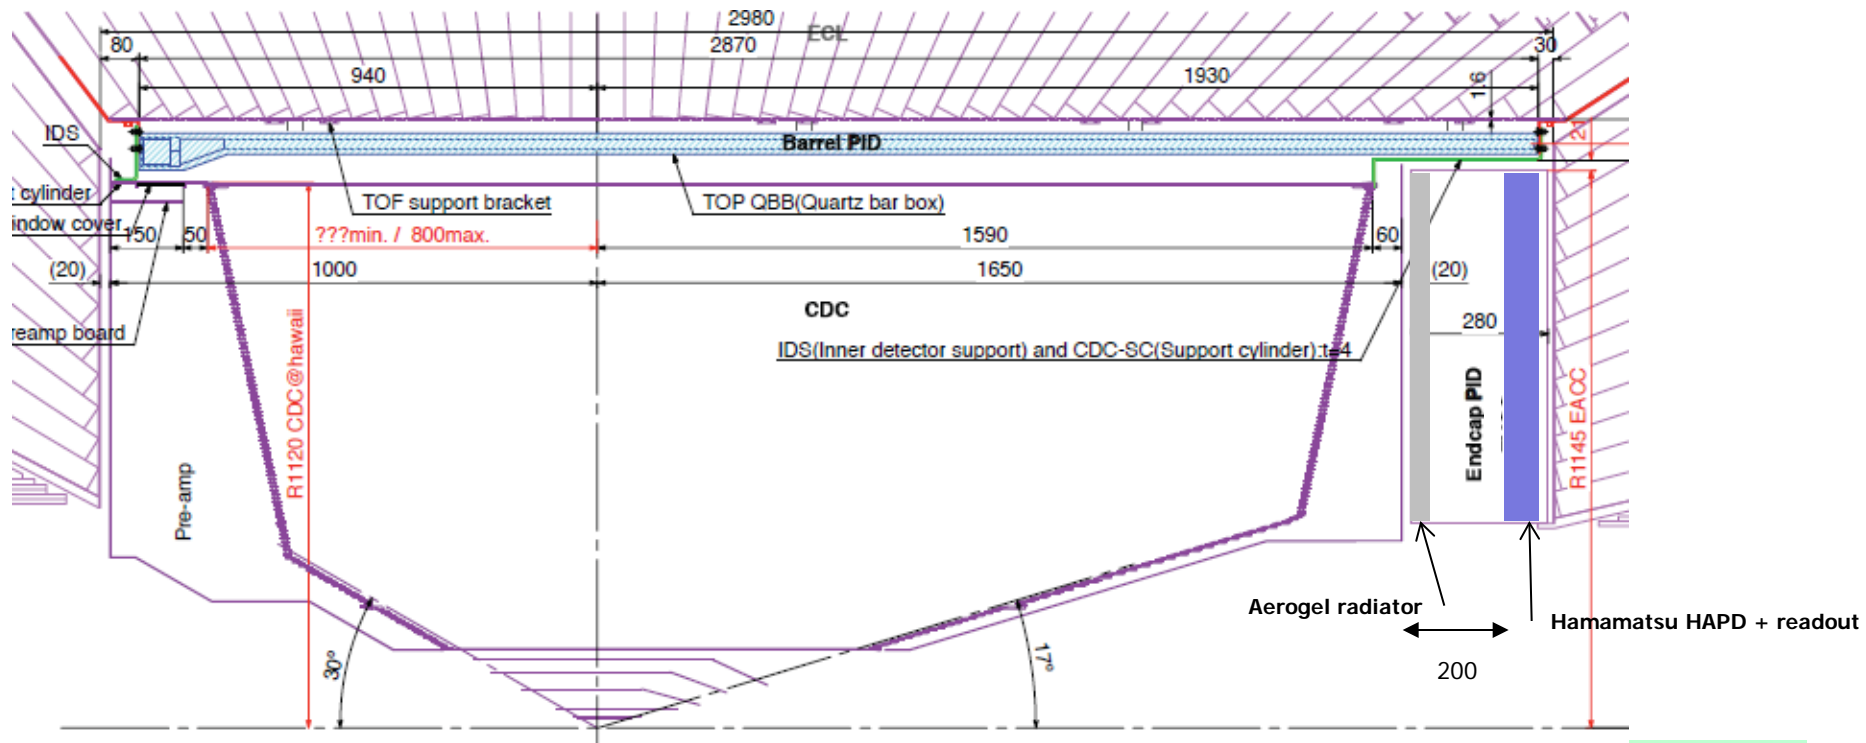

NIM A594 (2008) 13

# Cherenkov detectors

## Barrel PID: Time of Propagation Counter (TOP)

## Endcap PID: Aerogel RICH (ARICH)

# DIRC (@BaBar) - detector of internally reflected Cherenkov light

# Belle II Barrel PID: Time of propagation (TOP) counter

- Cherenkov ring imaging with precise time measurement.
- Device uses internal reflection of Cherenkov ring images from quartz like the BaBar DIRC.
- Reconstruct Cherenkov angle from two hit coordinates and the time of propagation of the photon
  - Quartz radiator (2cm)
  - Photon detector (MCP-PMT)
    - Excellent time resolution  $\sim 40$  ps
    - Single photon sensitivity in 1.5

# Muon (and $K_L$ ) detector

**Separate muons from hadrons (pions and kaons):** exploit the fact that muons interact only e.m., while hadrons interact strongly  $\rightarrow$  need a few interaction lengths (about 10x radiation length in iron, 20x in CsI)

**Detect  $K_L$  interaction (cluster):** again need a few interaction lengths.

$\rightarrow$  Put the detector outside the magnet coil, and integrate into the return yoke

Some numbers: 3.9 interaction lengths (iron)

Interaction length: iron 132 g/cm<sup>2</sup>, CsI 167 g/cm<sup>2</sup>

$(dE/dx)_{\min}$ : iron 1.45 MeV/(g/cm<sup>2</sup>), CsI 1.24 MeV/(g/cm<sup>2</sup>)  $\rightarrow \Delta E_{\min} = (0.36+0.11)$  GeV = 0.47 GeV  $\rightarrow$  identification of muons above  $\sim 600$  MeV

# Muon and $K_L$ detector

Example:

event with

- two muons and a
- $K_L$

and a pion that  
partly penetrated

# Muon and $K_L$ detector performance

Muon identification  $> 800$  MeV/c

efficiency

Fig. 109. Muon detection efficiency vs. momentum in KLM.

fake probability

Fig. 110. Fake rate vs. momentum in KLM.

# Muon and $K_L$ detector performance

$K_L$  detection: resolution in direction →

$K_L$  detection: also with poss with electromagnetic calorim (0.8 interaction lengths)

Fig. 107. Difference between the neutral cluster and the direction of missing momentum in KLM.

# Belle II, detection of **muons and $K_L$ s**: Parts of the present RPC system have to be replaced to handle higher backgrounds (mainly from neutrons).

$K_L$  and muon detector:  
 Resistive Plate Counter (barrel)  
 Scintillator + WLSF + MPPC (end-caps + barrel 2 inner layers)

# Muon detection system upgrade in the endcaps

## Scintillator-based KLM (endcap and two layers in the barrel part)

- Two independent (x and y) layers in one superlayer made of orthogonal strips with WLS read out
- Photo-detector = avalanche photodiode in Geiger mode (SiPM)
- ~120 strips in one 90° sector (max L=280cm, w=25mm)
- ~30000 read out channels
- Geometrical acceptance > 99%

Mirror 3M (above groove & at fiber end)

Optical glue increases the light yield by ~ 1.2-1.4)

WLS: Kurarai Y11  $\varnothing$ 1.2 mm

GAPD

Diffusion reflector ( $\text{TiO}_2$ )

Strips: polystyrene with 1.5% PTP & 0.01% POPOP

# Calorimetry in Belle II

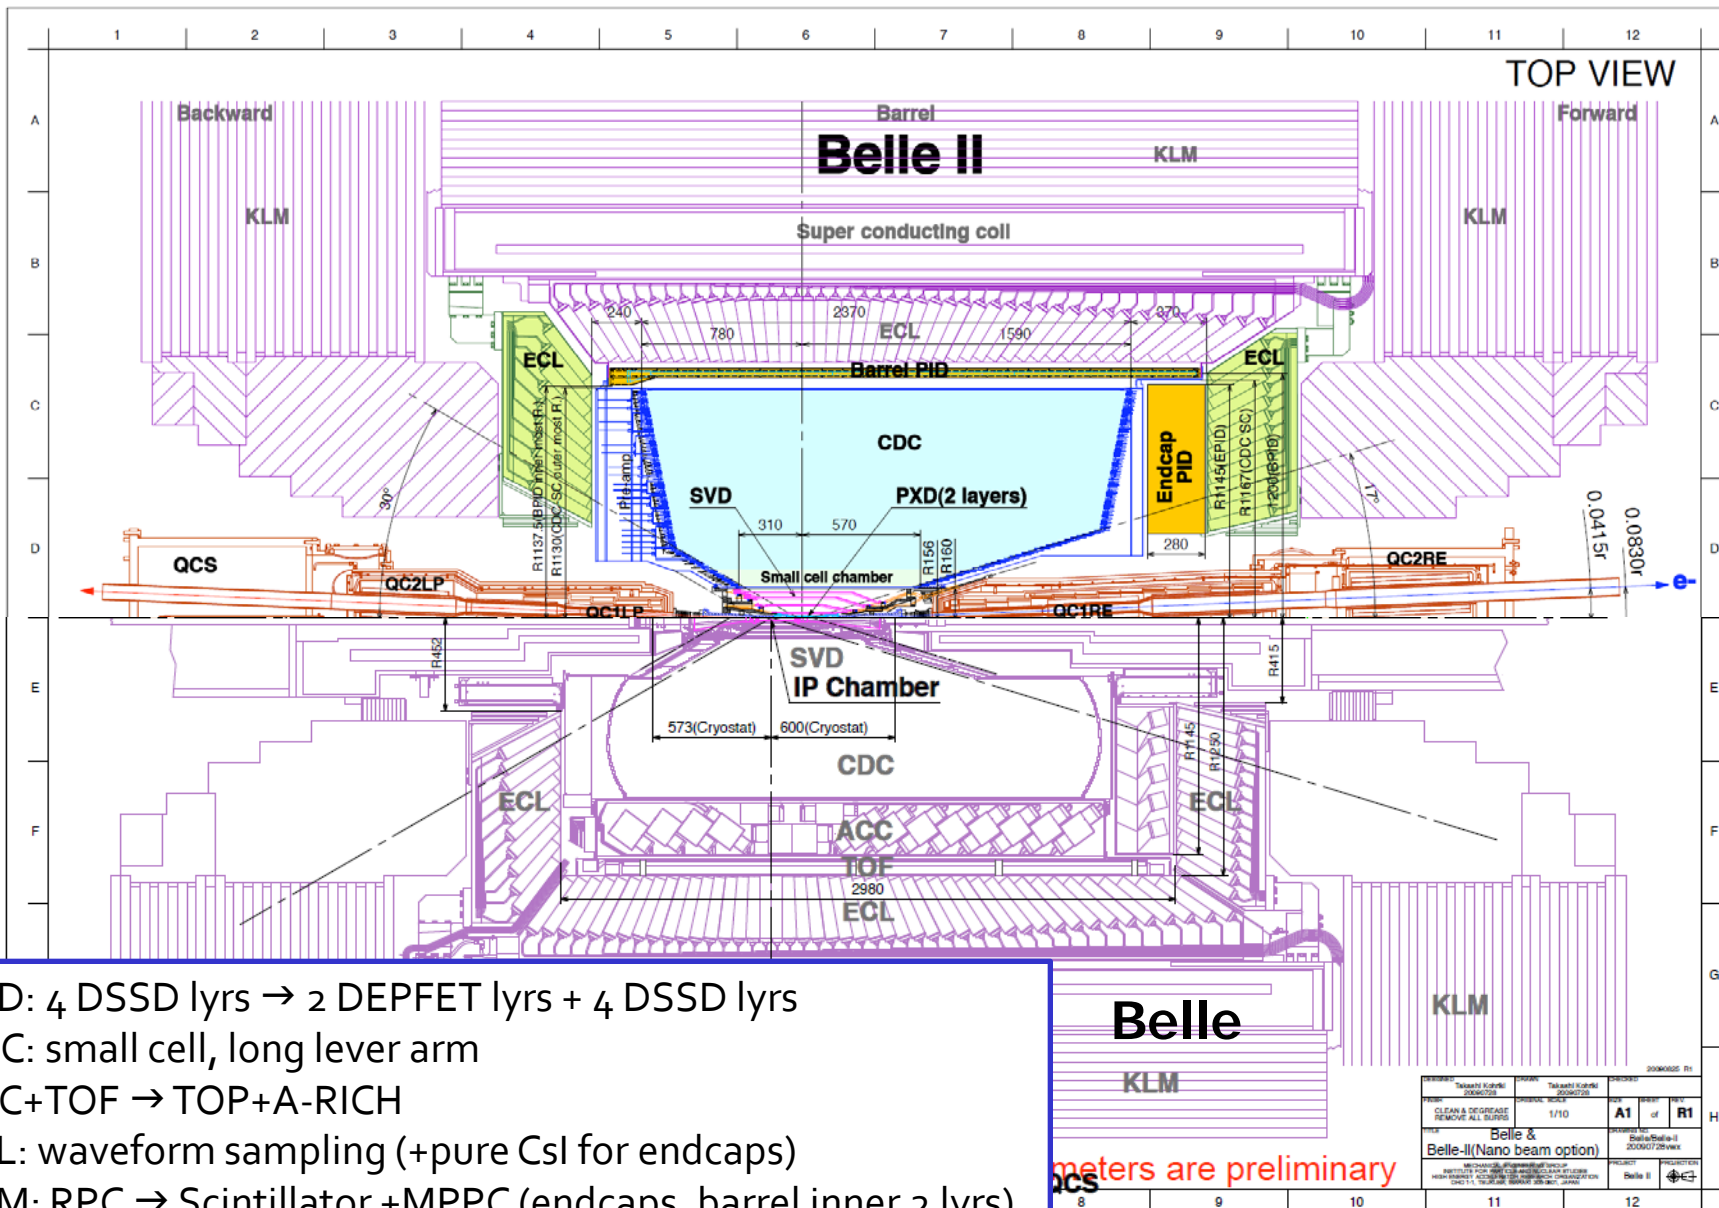

# Requirements: Photons

# Belle II Detector (in comparison with Belle)

SVD: 4 DSSD lyrs → 2 DEPFET lyrs + 4 DSSD lyrs  
 CDC: small cell, long lever arm  
 ACC+TOF → TOP+A-RICH  
 ECL: waveform sampling (+pure CsI for endcaps)  
 KLM: RPC → Scintillator +MPPC (endcaps, barrel inner 2 lyrs)

EM calorimeter: upgrade needed because of **higher rates**  
(barrel: **electronics**, endcap: **electronics** and CsI(Tl) → **pure CsI**), and **radiation** load (endcap: CsI(Tl) → **pure CsI**)

EM Calorimeter:  
CsI(Tl), waveform sampling (barrel)  
Pure CsI + waveform sampling (end-caps)

EM calorimeter: upgrade needed because of

- higher rates (barrel: **electronics**, endcap: **electronics** and CsI(Tl) → **pure CsI**), and
- radiation load (endcap: CsI(Tl) → **pure CsI**)

Pure CsI is faster, but has a smaller light yield...

→ replace photodiodes with a special kind of PMT (photopentode) that can be operated in magnetic field

# Status of the project

---

# The Belle II Collaboration

A very strong group of ~480 highly motivated scientists!

# Schedule

The schedule is likely to shift by a few months because of a new construction/commissioning strategy for the final quads.

# Conclusion

- KEKB has proven to be an excellent tool for flavour physics, with **reliable long term** operation, breaking world records, and **surpassing** its design performance by a factor of two.
- Major upgrade at KEK in 2010-15 → SuperKEKB+Belle II, with **40x larger** event rates, **construction well under way**
- Expect a new, exciting **era of discoveries**, complementary to the LHC
  
- There is a lot of work to be done – if you are interested, join us!

# Search for particles which decayed close to the production point

How do we reconstruct final states which decayed to several stable particles (e.g., 1,2,3)?

From the measured tracks calculate the invariant mass of the system ( $i= 1,2,3$ ):

$$Mc^2 = \sqrt{(\sum E_i)^2 - (\sum \vec{p}_i)^2 c^2}$$

The candidates for the  $X \rightarrow 123$  decay show up as a peak in the distribution on (mostly combinatorial) background.

The name of the game: have as little background under the peak as possible without losing the events in the peak (=reduce background and have a small peak width).

# How do we know it was precisely this reaction?

For  $\pi^- \pi^+$  in  $\mu^- \mu^+$  pairs we calculate the invariant mass:

$$M^2 c^4 = (E_1 + E_2)^2 - (\mathbf{p}_1 + \mathbf{p}_2)^2$$

$M c^2$  must be for  $K_S^0$  close to 0.5 GeV,

for  $J/\psi$  close to 3.1 GeV.

Rest in the histogram: random coincidences ('combinatorial background')

# Identification with dE/dx measurement 2

Problem: long tails (Landau distribution, not Gaussian)

# Identification with $dE/dx$ measurement 3

Optimisation of the counter: length  $L$ , number of samples  $N$ , resolution (FWHM)

If the distribution of individual measurements were Gaussian, only the total sample thickness would be relevant.

Tails: eliminate the largest 30% values  $\rightarrow$  the optimum depends also on the number of samples.
